

ShipAVM – Address Validation

Do you know companies can significantly reduce shipping cost, improve performance and customer loyalty by validating the addresses before it is shipped?

More than 50% of businesses do not have strong confidence in their data. With real-time address validation functionality, you can increase your confidence in your address data.

The ShipAVM™ module checks a customer's address and provides suggested alternatives if an error is discovered before it is shipped.

It performs street-level address validation within SAP at the customer/business partner master record creation, at sales order creation, or at time of shipment creation.

DELIVERABLES

- Street Level Address Validation within SAP at customer/business partner master record creation
